Management of Acute Type B Aortic Dissection

- The optimal therapy for acute uncomplicated type B aortic dissection (AUTBAD) has yet to be determined
- Over the past decade, TEVAR has challenged the use of optimal medical therapy (OMT)
- We sought to identify predictors of failure of OMT from the initial imaging scan

Methods

- Prospective database of patients with acute uncomplicated type B aortic dissection undergoing OMT
- Single academic institution, 2000-2023
- Outcomes
 - Continued OMT
 - Failure of OMT (including need for aortic intervention or death from any cause)

Baseline Characteristics

	All Patients N=217	Continued OMT N=112	Failure of OMT N=105	P-value
Age (years) – mean (SD)	56.6 (11.9)	56.6 (2.0)	56.7 (11.9)	0.939
Male sex – no. (%)	141 (65.0)	71 (63.4)	70 (66.7)	0.613
Race – no. (%)				0.551
- White	65 (30.4)	33 (29.5)	32 (31.4)	
- Black	147 (68.7)	78 (69.6)	69 (67.7)	
- Asian	1 (0.5)	1 (0.9)	0	
- Native American	0	0	0	
- Hawaiian or Pacific Islander	0	0	0	
- More than one race	1 (0.5)	0	1 (1.0)	
Connective tissue disease – no. (%)	7 (3.2)	3 (2.7)	4 (3.8)	0.637
Hypertension – no. (%)	204 (94.0)	104 (92.9)	100 (95.2)	0.460
Congestive heart failure – no. (%)	23 (10.6)	14 (12.5)	9 (8.6)	0.347
Myocardial infarction – no. (%)	10 (4.6)	3 (2.7)	7 (6.7)	0.161
Cerebrovascular accident – no. (%)	17 (7.8)	10 (8.9)	7 (6.7)	0.535
Family history – no. (%)	8 (3.7)	3 (2.7)	5 (4.8)	0.423
Cocaine use – no. (%)	13 (6.2)	6 (5.6)	7 (6.9)	0.694

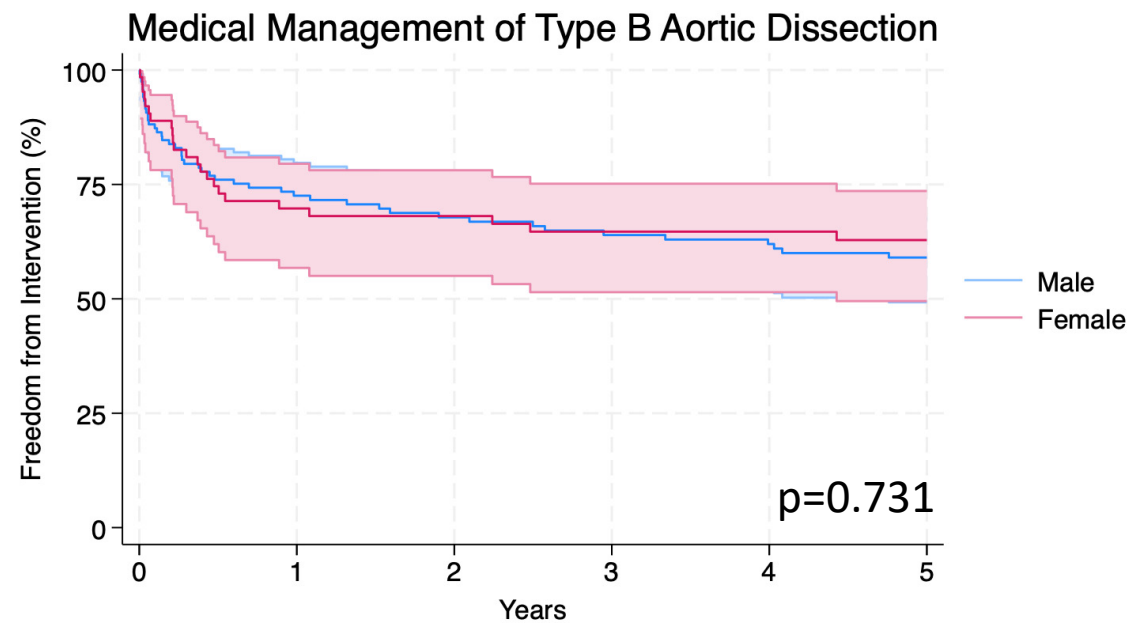

Patients who continued with medical management were similar in demographics to those who failed OMT

Outcomes by Age and Sex

Number at risk	0	1	2	3	4	5
Age<70	160	106	93	87	82	76
Age>=70	22	20	18	17	17	17

Number at risk	0	1	2	3	4	5
Male	118	83	71	66	63	59
Female	64	43	40	38	36	34

Age <70 years was associated with failure of OMT

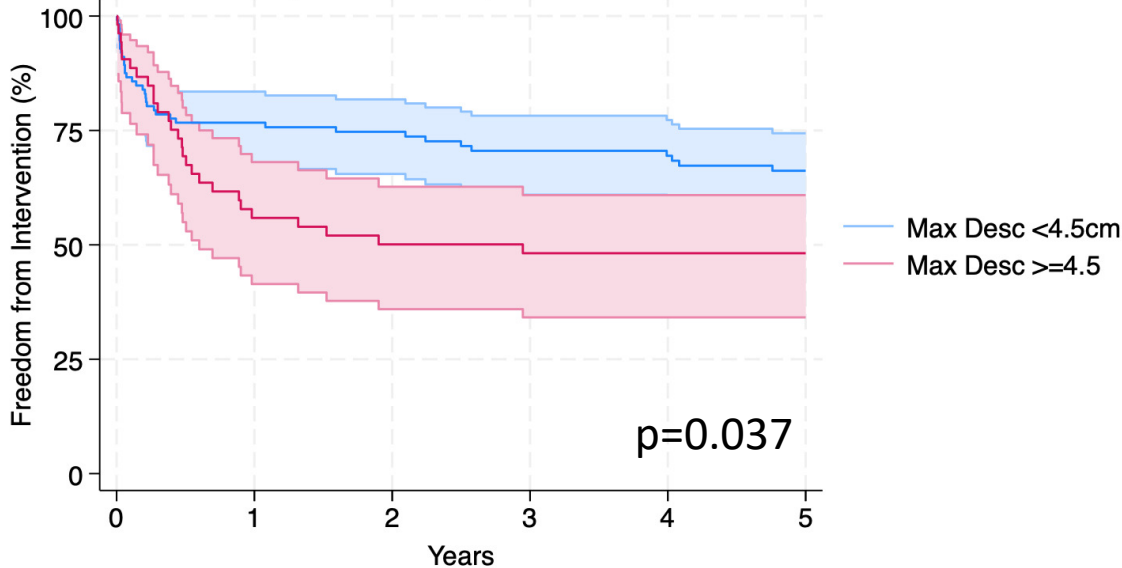

Sex was not associated with failure of OMT

EMORY

Aortic Diameter

Maximum Descending Thoracic Aortic Diameter
<4.5cm versus ≥4.5cm

Number at risk		0	1	2	3	4	5
Max Desc <4.5cm	113	84	73	68	64	60	
Max Desc ≥4.5	53	29	26	25	25	24	

Maximum Abdominal Aortic Diameter
<4.0cm versus ≥4.0cm

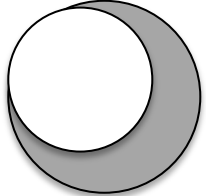

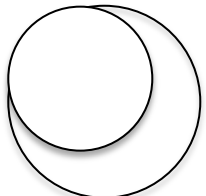

Number at risk		0	1	2	3	4	5
Max Abd <4.0cm	113	85	77	72	67	63	
Max Abd ≥4.0	26	14	12	11	11	10	

In a multivariable model, only abdominal aortic size (OR 2.24) was predictive of failure of OMT (p=0.022)

False Lumen Status

False Lumen Status on Initial Scan

	<u>Continued OMT</u>	<u>Failure of OMT</u>
 Complete Thrombosis	3.7%	2.9%
 Partial Thrombosis	45.8%	41.2%
 Patent	50.5%	55.9%

False lumen status on the initial scan was not predictive of failure of OMT

Branch Vessels Arising from False Lumen

	<u>Continued OMT</u>	<u>Failure of OMT</u>
 Celiac	13.2%	14.4%
 SMA	2.9%	6.0%
 Renals	50.9%	53.5%
 IMA	15.3%	24.2%
 Iliacs	42.1%	41.9%

There were no differences in outcomes based on whether branch vessels arose from the true or false lumen

The number of branch vessels arising from the false lumen was also not predictive of failure of OMT

Failure of OMT

Freedom from Aortic Intervention or Death
In Medical Management of Acute Uncomplicated
Type B Aortic Dissection

Freedom from Aortic Intervention
In Medical Management of Acute Uncomplicated
Type B Aortic Dissection

OMT was associated with a 50% failure rate at 5 years

Conclusions and Future Directions

- Medical management of acute uncomplicated type B aortic dissection is associated with a failure rate of 50% at 5 years
- Novel biomechanical and flow analyses will provide additional information to predict who will fail OMT
- Randomized trials between OMT and TEVAR are necessary to determine optimal therapy

Thank you
